How COVID-19 is spread

COVID-19 spreads very easily through close contact with people who have the virus.

When someone with COVID-19 breathes, speaks, coughs or sneezes, they release small droplets containing the virus. You can catch it by breathing in these droplets or touching surfaces covered in them.

You are more likely to catch it indoors and in crowded places.

You can still catch or spread COVID-19 if you:

- do not have symptoms
- are fully vaccinated
- have had the virus before

Many people will no longer be infectious to others after 5 days, but you can be infectious for up to 10 days.

Symptoms of COVID-19

COVID-19 symptoms can include:

- a high temperature or shivering (chills) – a high temperature means you feel hot to touch on your chest or back (you do not need to measure your temperature)
- a new, continuous cough – this means coughing a lot for more than an hour, or 3 or more coughing episodes in 24 hours
- a loss or change to your sense of smell or taste
- shortness of breath
- feeling tired or exhausted
- an aching body
- a headache
- a sore throat
- a blocked or runny nose
- loss of appetite
- diarrhoea
- feeling sick or being sick

The symptoms are very similar to symptoms of other illnesses, such as colds and flu.

Most people feel better within a few days or weeks of their first COVID-19 symptoms and make a full recovery within 12 weeks. For some people, it can be a more serious illness and their symptoms can last longer.
